

.....

cyfly Network

How it works, and how it can affect your everyday life.

What is cyfly Network?

In the recent years, i've come to conclusion that in this world, human resources are a big problem. The biggest waste you currently have in this world is technology waste. We are destroying and throwing away so many tech things, while still running a lot of servers on the internet and using gas and electricity for it. How can it be solved?

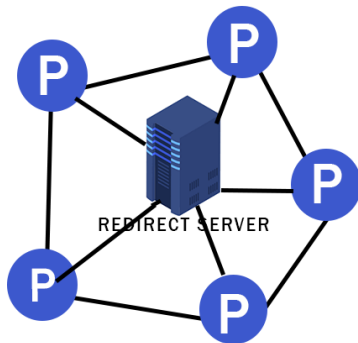

Using cyfly Network.

cyfly Network is a peer-to-peer network protocol for web browsing that utilizes file system called one-for-everybody.

How does cyfly Network work?

Our network works like this: every peer receives an encrypted file (that is encrypted with the creator's own machine key) and hosts it on his daemon server. Now, because everything is encrypted, when somebody wants to access a certain site on our network, it has to first ask the peer to retrieve the file, then it has to ask a creator to decrypt it for him. So that means , no one can make any public changes to the website, no one except the actual creator that owns that private key.

Example of connecting
